Abstract

Granulation is a standout amongst the most vital unit tasks in the generation of pharmaceutical oral measurements frames. Granules are the basic portions in the midst of arrangement of tablets. So nature of granules is the determinant for nature of tablet. Moreover granules present the better pharmacokinetics parameter, for instance, maintenance of dynamic components of tablet. This study is basically a short note on the different types of granulation process, herbal preparation of granules and its up-gradation/advancements. Granulation strategy will improve stream and weight characteristics, reduce confinement, improve content consistency, and discard unrestrained proportions of fine particles. Herbal drugs can also be incorporated into granules so as to prepare herbal drug tablets. By then the most ideal granulation method can be associated. The objective of present article is to focus on the basic granulation idea and encourage the researchers to use these techniques in herbal preparations.
